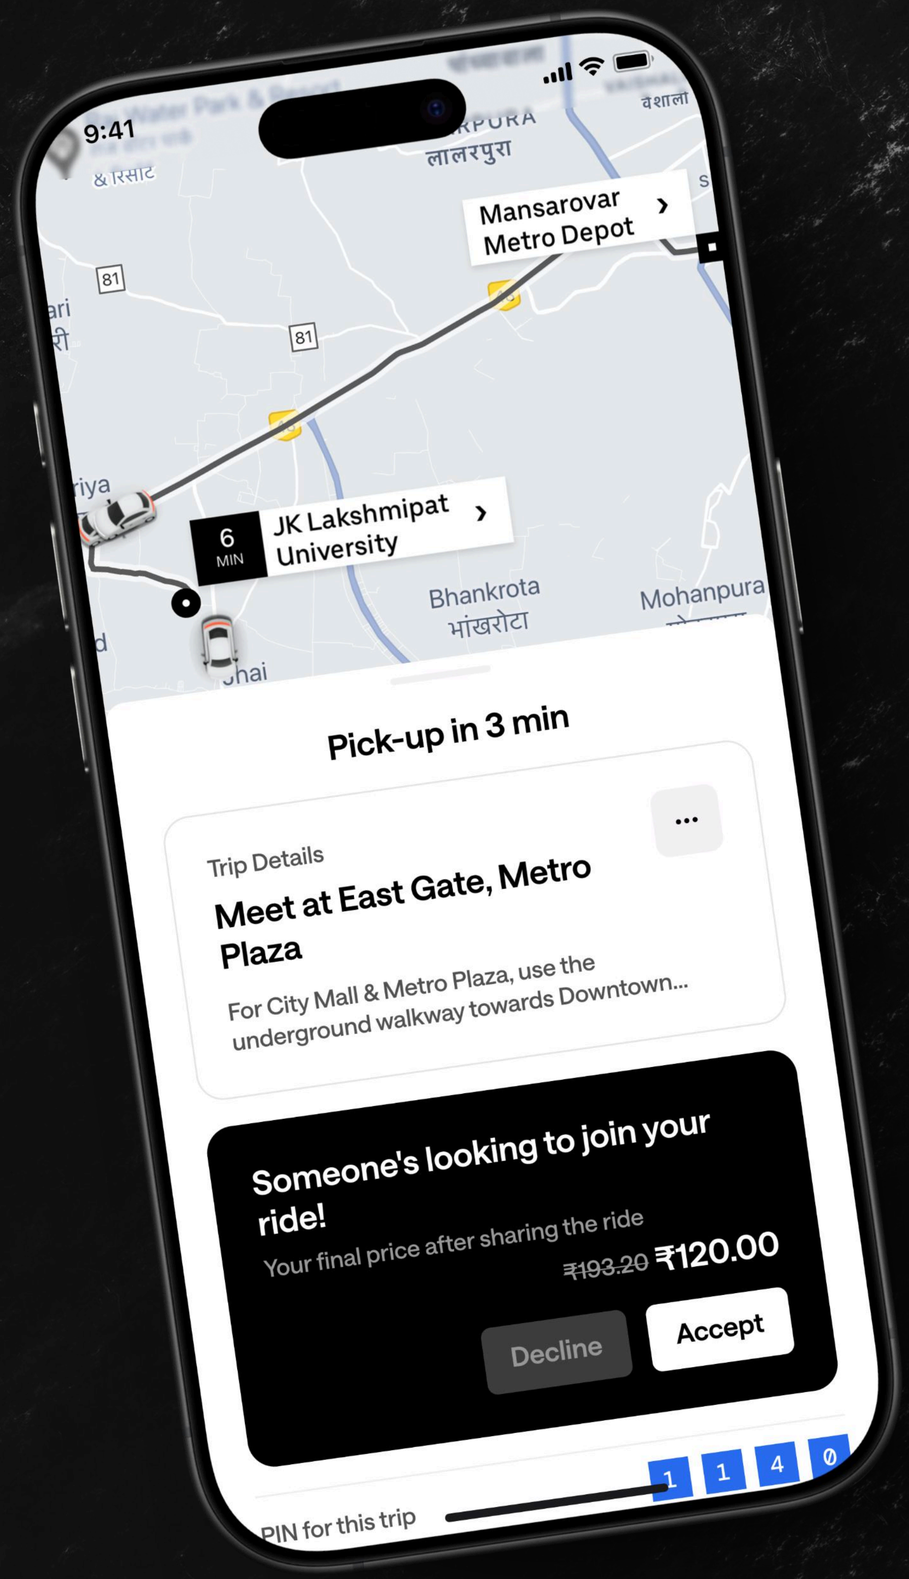
# Uber

## Enhancing ride sharing experience with **Dynamic Carpooling**



PERSONAL PROJECT

## Background

UberPool is great for efficiency but has a major drawback—riders must commit to carpooling before booking, which might not always align with their preferences.

This case study presents a new feature: Dynamic Carpooling—a flexible way for users to choose carpooling after their ride has started. This enhances ride efficiency while keeping user preferences in mind.

## The Problem

Despite UberPool's existence, many users hesitate to opt in beforehand because:

- They worry about potential delays due to additional pickups
- They want a guaranteed ride first, and later decide if sharing is okay
- Fixed carpool pricing upfront might not always be the best deal

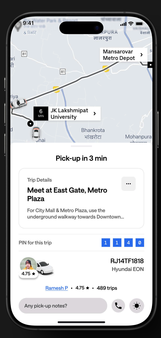
## A more dynamic carpooling option allows flexibility, letting riders decide in real time

# Design Solution

## User Flow

### Booking Phase

Users toggle “Open to Carpool?” before booking. No impact on their initial fare or ETA.

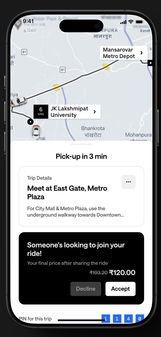


### Ride accepted and in progress

The ride begins as a private trip.
If another rider enables carpooling and their route aligns, the system finds a match.

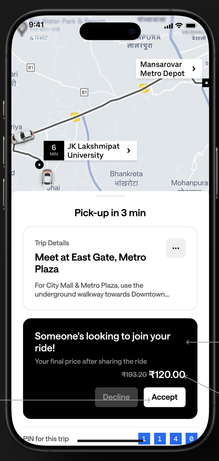
### Lock Screen Notification

A push notification appears when there is a match. Riders can tap to open the Uber app and review details



### Uber App – Ride Share Request

A popup prompts that someone is looking to share the ride.
New fare after sharing is displayed.
**Accept** and Decline buttons for quick decision making



This should feel non-intrusive, so that riders can decide with minimal effort

Price adjustments should be clear

Final decision will be in the hands of the rider whether or not to accept

# Impact & Future Scope

Despite UberPool’s existence, many users hesitate to opt in beforehand because:

### Better Ride Utilization

Fewer empty seats mean more sustainable travel

### Cost Savings

Riders get the flexibility to share rides when it’s convenient
